

Get the latest build

Two minutes. This morning's runs were V4.2 from the old branch; everything built since is on a new branch.

1 Run these five lines

PowerShell, in your Hoover folder (`D:\Repository001`). Game closed or open, it does not matter.

```
git stash
git fetch origin
git checkout claude/v4-state-blob
git pull
python T11_F125_Baby_Hoover_V4_050CT26.py --version
```

2 Check the first line it prints

It must read like this (the seven characters after `@` are the commit; yours should be `630af7e` or newer):

```
Baby Hoover V4.3 (build 080CT26, script 4.3.0) · claude/v4-state-blob @ 630af7e
```

If you see	It means	Do
V4.3 and <code>claude/v4-state-blob</code>	You have the latest build	Done. Go to step 3
V4.3 but <code>@ e04bb7a</code> or older, or <code>git pull</code> printed an error	The branch is right but the last fix did not come down	Run <code>git pull</code> again, then <code>--version</code> ; if the same, send the screen
V4.2 (build 070CT26)	Still on the old branch; the checkout did not take	Send Dustin the message <code>git checkout</code> printed. Do not force it
Any data file not <code>ok</code> in the list below the first line	A file is missing beside the tool	Send a photo of the screen

3 Sound check, then send the line

Your device settings live outside the repo, so the branch switch does not touch them, but the tool file is new, so run the check once:

```
python T11_F125_Baby_Hoover_V4_050CT26.py --audio-check
```

Four green = good. Then send Dustin the `--version` line from step 2. That one line is the confirmation.

! What changed in this build

Tyres and lobby settings are read from the wire, the booth gets a fuller picture of the race, and **no two cars can share a spoken name**: this morning eleven cars aired as "the number 2 car". A car with no usable name is now its team (if unique) or "the car running fourth", and a line naming the same car twice never airs. Your V2 run sheet, steps 2 to 4, still applies after this card.
